

The Security Matrix

	People	Physical	Networks	Computer Equipment
Prevention				
Detection				
Reaction				

The Security Matrix: uses

- Use the matrix to focus measures where they are needed, and to be aware of what measures are being (purposely) neglected.
- Drawing a threat/risk landscape. What areas are most at risk? Acceptable downtime.
- Define future measures, baselines, or project specific security
- Relating security topics.
- Dept & diversity of defence
- List/audit current measures
- Follow changes in focus over time
- Divide “Computer Equipment” according to your needs, e.g. : OS, DBs, Middleware, Applications

Examples

	People	Physical	Networks	Computer Equipment
	Users, managers, admins	Buildings, server rooms, laptops, diskettes, backups..	Telephone, fax, voicemail, IP tel., Internet , Intranet, VPN, SNA, Novel, Dialup	Servers, workstations, laptops, routers, hubs, switches,

General measures

Prevention	Physical, technical, continual re-assessment, resource isolation,
Detection	Audits, looking for unusual behaviour
Reaction	Panic? .. disciplinary action, forensics/detective work

Measures

	People	Physical	Networks	Computers (OS + Applications)
Prevention	<p>Policy, processes, responsibility, roles, education, goodwill..</p> <p>Documentation: architecture/ services/ changelog. Good Programming. Continual re-assessment. Release mgt</p>	<p>Locks (several layers), logging..</p> <p>cameras,</p> <p>security guards,</p>	<p>Network firewall,</p> <p>switches not hubs</p> <p>anti-spoofing</p> <p>content filtering</p> <p>strong authentication</p> <p>resource isolation</p> <p>encryption</p>	<p>Hardening</p> <p>local/personal firewall</p> <p>log analysis</p> <p>anti-virus & updates</p> <p>redundancy & backups</p> <p>resource isolation</p> <p>encryption</p>
Detection	<p>audits</p>	<p>Cameras,</p> <p>alarms</p> <p>Security guards</p>	<p>NIDS, logs,</p> <p>traffic changes</p> <p>Scanning</p>	<p>Log analysis</p> <p>integrity checker</p> <p>local/personal IDS</p>
Reaction	<p>Discipline</p> <p>Incident Response Team</p>		<p>Firewall rules</p> <p>Unplug networks</p>	<p>Unplug from network,</p> <p>shutdown,</p> <p>Reinstall, fix, ignore,</p> <p>Forensics</p>

Security Mechanisms

Technical countermeasures

Organisational aspects

- 👉 Process security
- 👉 Clear policies, known, enforced.
- 👉 Security process: manage risk.
- 👉 Only expose necessary systems.
- 👉 Education of the users and admins.
- 👉 Clear roles & responsibilities

Physical security

Legal threat

Audit & review

- 👉 System hardening (services, config, patches, accounts)
- 👉 Access control: local & network (packet screening, switched networks)
- 👉 content filtering (HTTP/Email/ftp)
- 👉 Encryption
- 👉 Resource isolation
- 👉 Strong authentication (VPN, RAS & FW)
- 👉 Good password management or tokens
- 👉 Intrusion detection networks/hosts (passive)
- 👉 Scanning networks/hosts (active)
- 👉 Traffic/statistics monitoring
- 👉 Correctly program/review/test code
- 👉 Backup/Restore procedures/processes

Trade-offs

-  Complexity
-  time / skills
-  rate of change
-  Performance
-  ease of use
-  cost
